

3 THINGS TO CONSIDER WHEN PURCHASING A HYDROJET

1. CUSTOM CONFIGURATION

The device and operability should be adaptable to you and your company with an individually designed user interface. Ensure that it is not the other way around, where it is you who has to adapt to the device.

The possibility of different configurations depending on the application is an advantageous feature. Perhaps a hotel only needs a start button, whereas medical applications may require the possibility of granting access via a preconfigured bracelet or a chip card. The individual data that has already been entered in this way for the person can be loaded for the next use. A chip card, for example, is optimal for this purpose.

2. SEPARATE NOZZLES AND DIFFERENT MOVEMENT PROCESSES

The machine must be as individual as the person whom it is massaging. Therefore, the nozzles must be individually controllable so that the left nozzle can operate differently than the right nozzle. Only then can it be ensured that every user or patient is treated purposefully and successfully based on their different symptoms.

3. VARYING WATER PRESSURE

The pressure of the massage should be continuously variable and individually adaptable for both sides. Many water jet beds that cannot operate with continuously variable water pressures only allow for the water pressure to be activated or deactivate with full water pressure or no water pressure at all. If the bed has the option of a pulsating massage with a continuously variable pressure curve, muscle tension can be relieved with a "smoothing out" technique. There should be no limitations on your creativity when creating massages!
